Part II introducing new MSA2000 G2

4AA2-5505ENW

Speaker name : Mo Azam
Worldwide Product Manager - StorageWorks
updated : June 2nd, 2009

Index

Introducing the new MSA2000 G2

"Twice the number of drives, twice the performance, four times the number of snapshots, and support for small form factor drives with Integrity and ProLiant servers"

HP StorageWorks 2000 G2 Modular Smart Arrays

More affordable

- More affordable interconnects allow you to easily add storage as your business grows
- Use 50% less power with small form factor (SFF) 2.5" SAS drives

Invest with confidence

- Protect your data with broad RAID support
- Upgrades and interconnect changes supported

Increased efficiency

- 33 percent more storage capacity per unit of rack space for SFF SAS drives over 3.5" drives
- Increase storage utilization with tiered storage (SAS for high performance applications and SATA for less frequently accessed data)

Flexibility and performance unmatched by ANY entry-level array product in the market

What's new

	MSA2000	New MSA2000 G2
Drives (SAS & SATA)	• MSA2 Large Form Factor LFF	• MSA2 3.5" Large Form Factor LFF • ProLiant 2.5" Small Form Factor SFF
Max drives	• 48 LFF	• 60 LFF • 99 SFF
Servers	• x86	• X86 • Integrity c-class Blades
Operating Systems	• Windows • Linux	• Windows • Linux • VMware • HP-UX (for MSA2000sa G2 Only) • Solaris
Software	• Snapshot (max 64 snaps)	• Snapshot (max 255 snaps)
Max LUNs	• 256	• 512

MSA2000 G2 benefits

New MSA2000 G2 features	Added Customer benefits
Support for 2.5-in. drives	Common with ProLiant: potential performance gain
Support for MSA70 enclosure	Common with ProLiant (plus legacy ROI support)
New MSA2300 high-speed controller	Faster processor, higher performance
Increased scalability & 512 LUN support	Up to 60 LFF 3.5-in drives; up to 99 SFF 2.5-in drives
HP-UX and OpenVMS support and Integrity servers	Entry-level SAN support for HP's most powerful OSes
Enhanced point-in-time copy with space-efficient snapshot	255 Snapshot capability
New DC power options	Opportunities in TELO and related industries

Unified LUN Presentation (ULP)

What is ULP?

- **U**nified **L**UN **P**resentation
- The intent of ULP is to make all LUNs in the system accessible through all ports on both Control Units
- ULP appears to the host as an active-active storage system where the host can choose any available path to access a LUN regardless of vdisk/LUN ownership
- Uses the T10 Technical Committee of INCITS* **A**symmetric **L**ogical **U**nit **A**ccess (ALUA) extensions, in SPC-3**, to negotiate portals (paths) with aware host systems. Unaware host systems see all paths as being equal

ULP basic overview

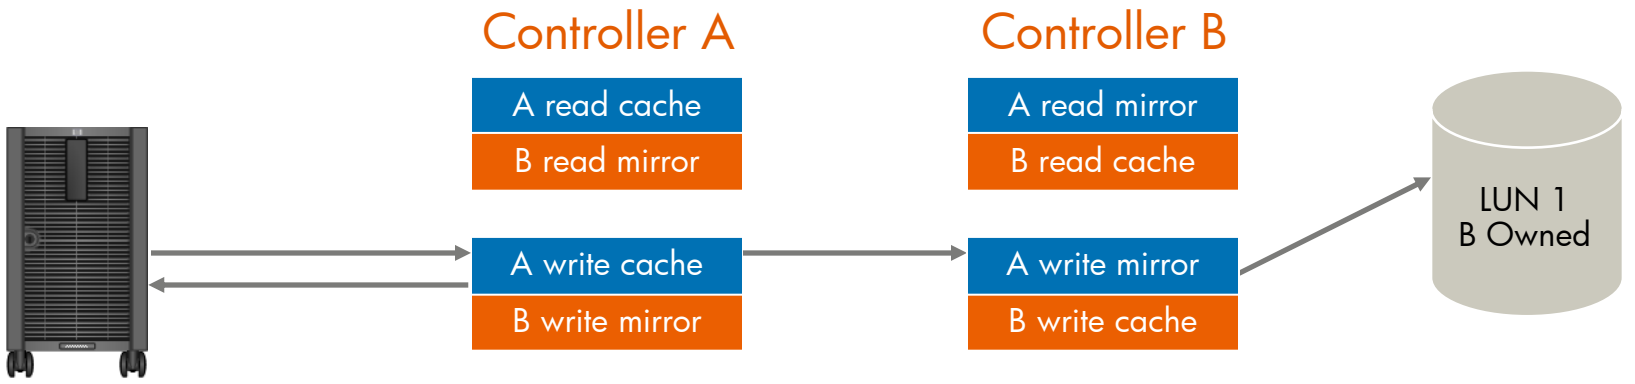
- ULP presents all LUNS to all host ports
  - Eliminates need for CU interconnect path (PBC)
  - Presents the same (single) WWNN for both CUs
- There is only one LUN name space (0-255)
  - No duplicate LUNs allowed between controllers
  - Either controller can use any unused logical unit #
- ULP recognizes which paths are “preferred”
  - The preferred path indicates which is the owning controller, per ALUA specifications
  - “Report Target Port Groups” identifies preferred path
  - Performance is slightly better on preferred path

ULP design

- Underlying concept is still vdisk ownership
- Vdisk ownership is transparent to host system
- ULP keeps the raid & disk firmware intact
  - No changes to raid and disk backend operation
- Host & cache firmware modules updated for ULP
  - Host module presents all LUNs on all ports
  - Data path routing modified at host and cache level
  - Cache mirrors write AND read operations
  - Owning controller always does I/O to disk

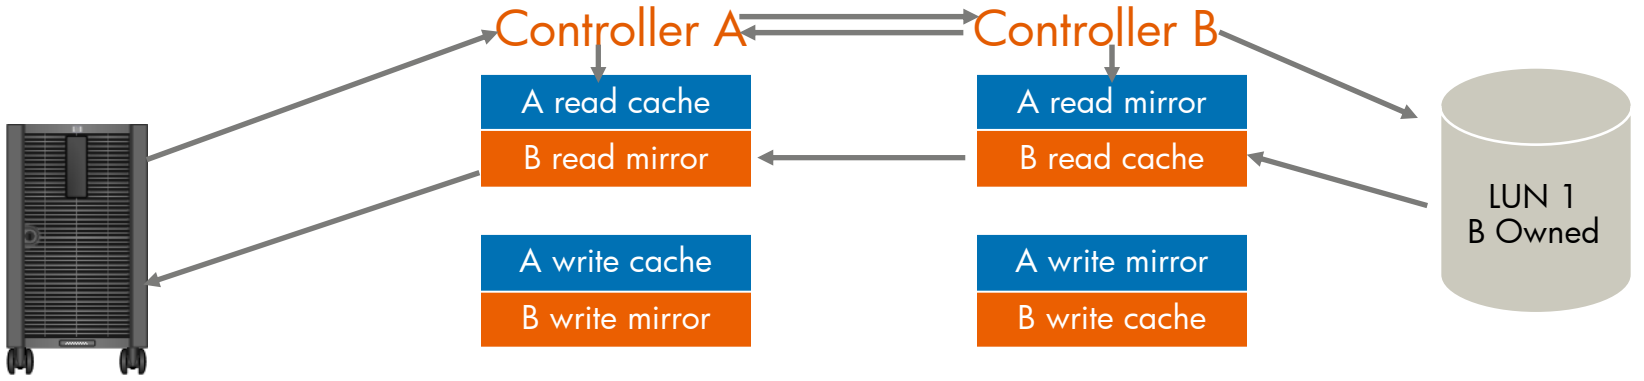
ULP – Write I/O processing

- Write command to controller A for LUN 1 owned by CUB:
  - The data is written to CUA cache and broadcast to CUA mirror
  - CUA acknowledges I/O completion back to host
  - Data written back to LUN 1 by CUB from CUA mirror



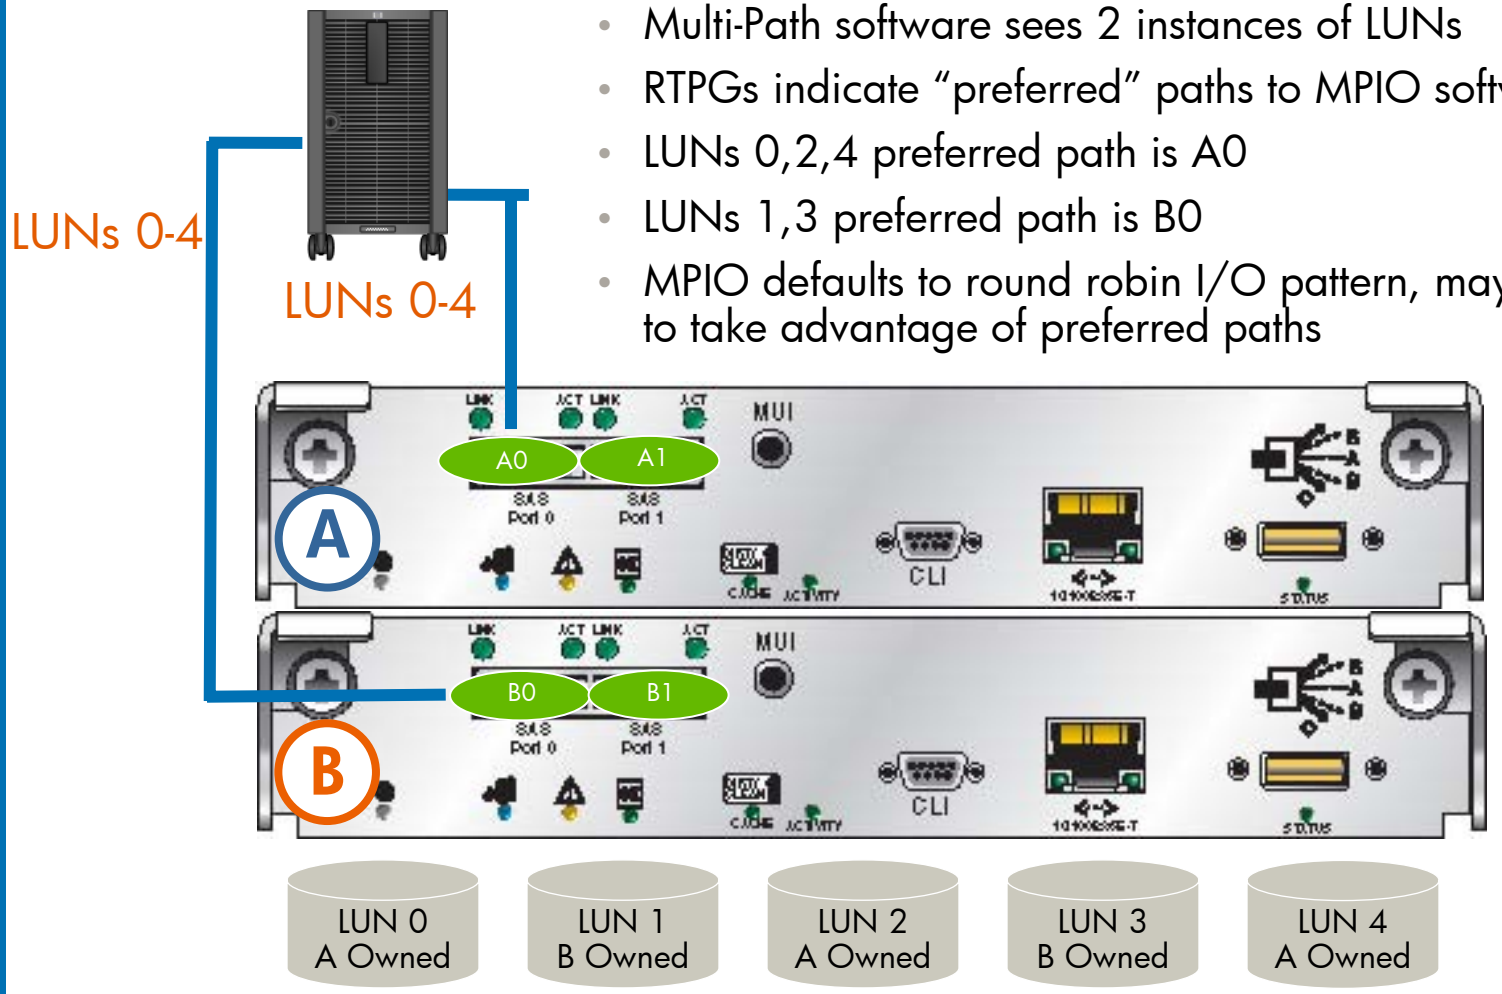
ULP – Read I/O processing

- Read command to controller A for LUN 1 owned by CUB:
  - CUA asks CUB if data is in CUB cache
  - If found, CUB tells CUA where in CUB read mirror cache it resides
  - CUA sends data to host from CUB read mirror, I/O complete
  - If not found, request is sent from CUB to disk to retrieve data
  - Disk data is placed in CUB cache and broadcast to CUB mirror
  - Read data sent to host by CUA from CUB mirror, I/O complete



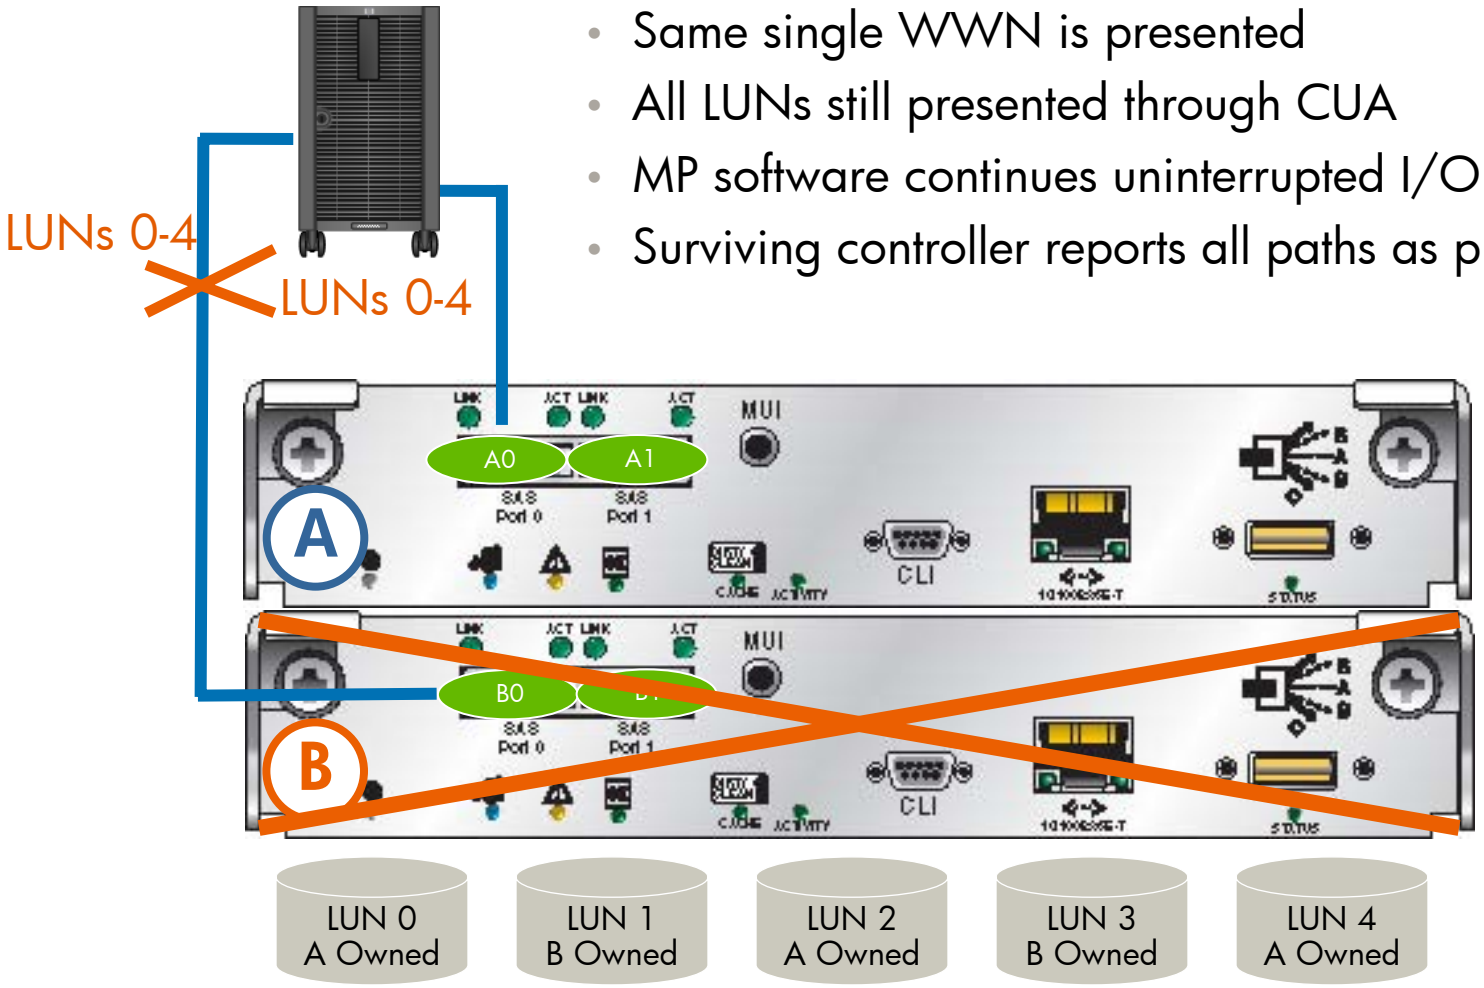
ULP – all LUNs presented to all

- LUNs 0-4 are available on all 4 host ports
- Multi-Path software sees 2 instances of LUNs
- RTPGs indicate “preferred” paths to MPIO software
- LUNs 0,2,4 preferred path is A0
- LUNs 1,3 preferred path is B0
- MPIO defaults to round robin I/O pattern, may be changed to take advantage of preferred paths



ULP – all LUNs presented: failover

- CUB fails, vdisk ownership transfers to CUA
- Same single WWN is presented
- All LUNs still presented through CUA
- MP software continues uninterrupted I/O
- Surviving controller reports all paths as preferred



Improved Web Based Interface Storage Management Utility (SMU)

Introduction

Installation overview

- Unpack the array
- Obtain the necessary accessories and equipment
- Mount the controller and expansion trays in a rack or cabinet
- Connect the AC power to the two power modules
- Perform initial power-up
- Connect the management hosts to the controller tray
- Connect the data hosts to the controller tray
- Use WBI or the CLI to set the Ethernet IP address, netmask, and gateway address, for each controller module
- Use WBI, or the CLI, to set the array date and time; change the management password
- Set the basic array configuration parameters
- Plan and implement your storage configuration

Connecting to a terminal emulator

- Start and configure a terminal emulator, such as HyperTerminal using the following settings:
  - Terminal Emulator Display Settings
    - Terminal Emulation Mode ANSI (for color support)
    - Font Terminal
    - Translations None
    - Columns 80
  - Terminal Emulator Connection Settings
    - Connector COM1 (typically)
    - Baud rate (bits/sec) 115,200
    - Data bits 8
    - Parity None
    - Stop bits 1
    - Flow control None

Setting up the IP address

- At the prompt (#), type the following command to set the IP address for controller A
  - Set network-parameters ip <address> netmask <netmask> gateway <gateway> controller <a|b>
- Verify Ethernet connectivity by pinging the IP addresses
- Optional
- At the prompt (#), use the same command to set the IP address for controller B except b
- Type the following command to verify the new IP addresses:
  - Show network-parameters

MSA2000fc G2 Management

Management via SMU and CLI

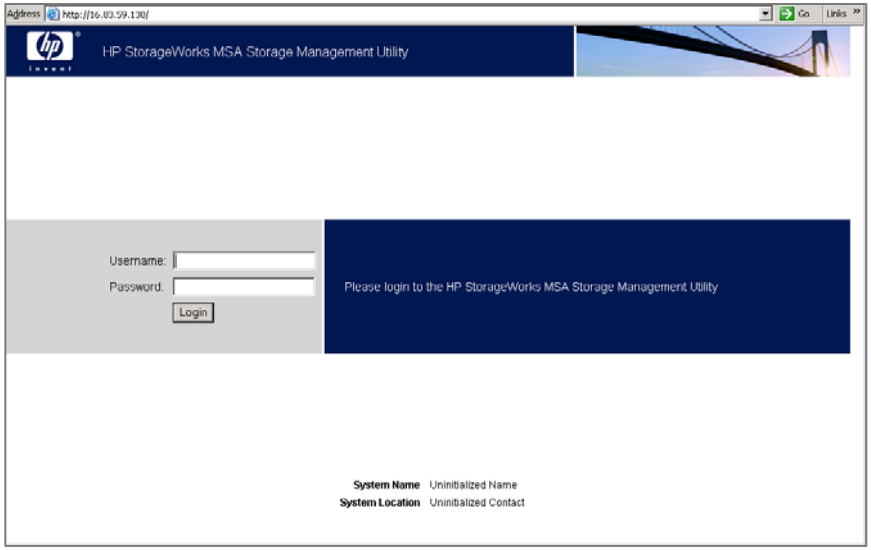
You can now manage your MSA2000fc G2 via:

1) Web-based Storage Management Utility (SMU) – It is the primary interface for configuring and managing the system. A web server resides in each controller module. SMU enables you to manage the system from a web browser that is properly configured and that can access a controller module through an Ethernet
2) Command Line View (CLI) – The embedded CLI enables you to configure and manage the system using individual commands or command scripts through an out-of-band RS-232 or Ethernet connection

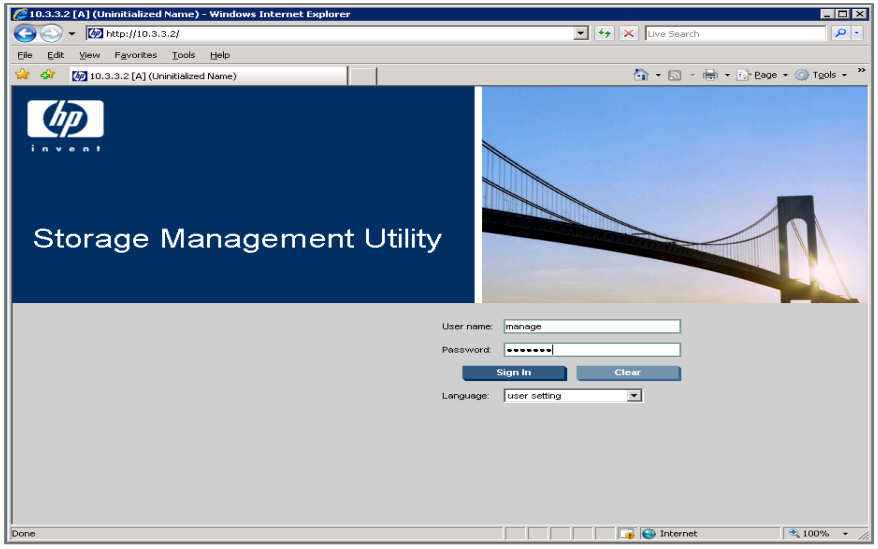
TIP: SMU uses popup windows to indicate the progress of user-requested tasks. Therefore, disable any browser features or tools that block popup windows

Comparison between old and new SMU

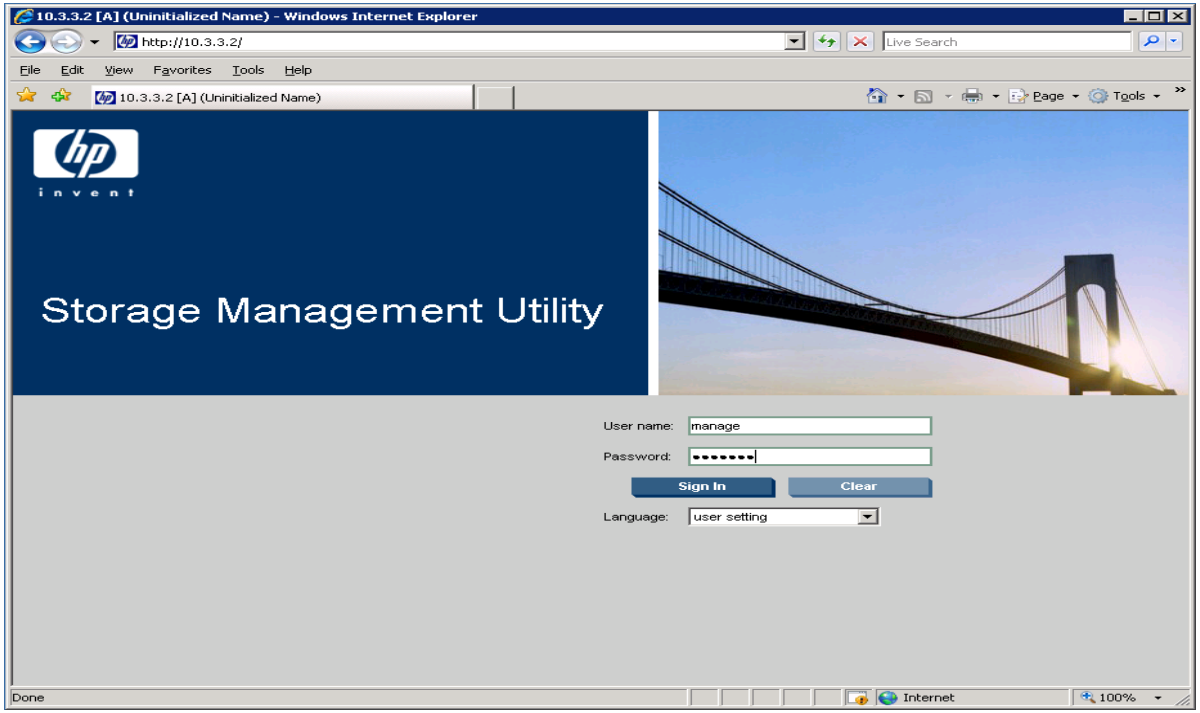
MSA2000fc



MSA2000fc G2



Logging into HP SMU

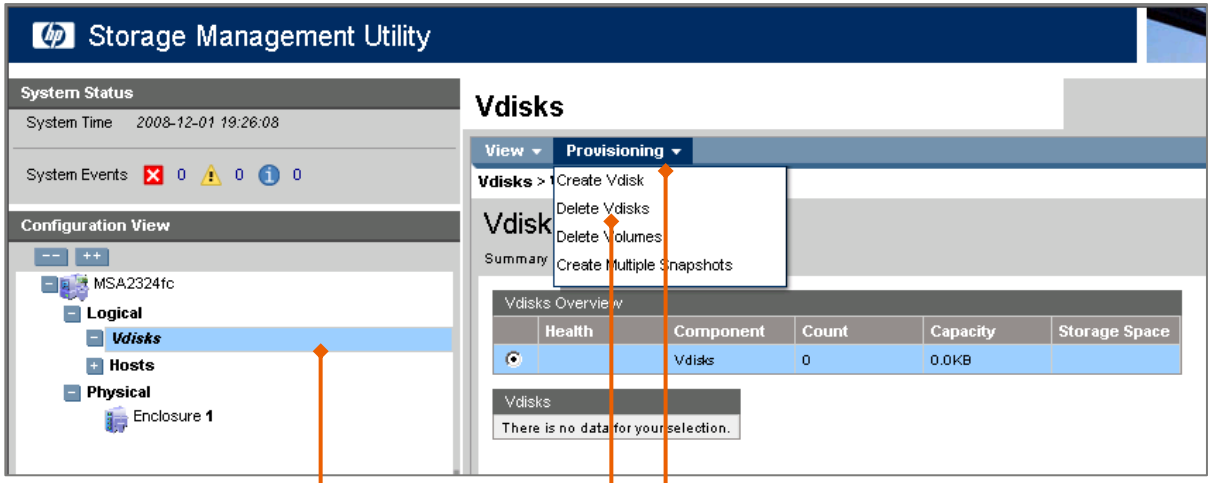


TIP

- In a web browser, type a controller module IP address in the address or location field and press Enter.
- Type the Username: **manage**
- Type the Password: **!manage**

Default Login Credentials

Creating Vdisk

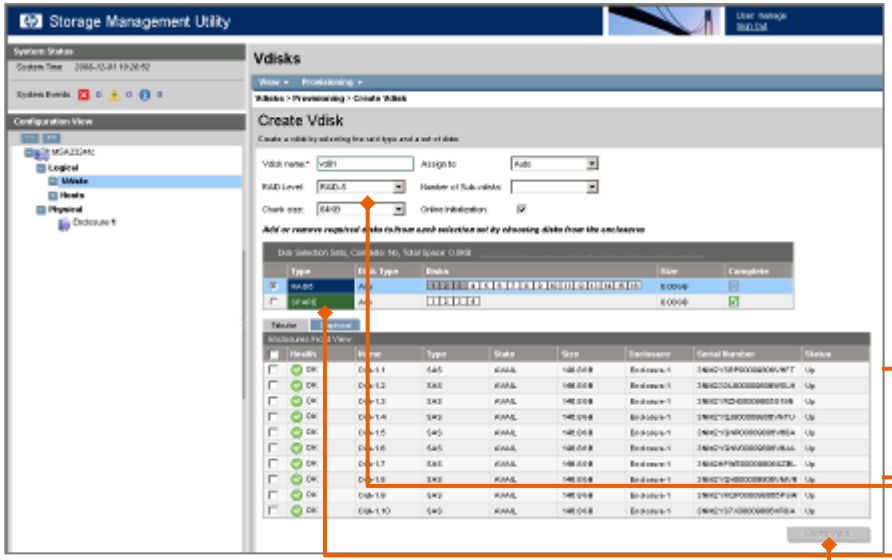


- Select Create a vdisk
- Click the "Provisioning"
- Click "Create Vdisk"
- This will bring up the "Vdisks" screen

Note – Drive Configs:

- RAID levels 3,5, 6 can contain a max of 16 disks
- RAID level 0, 50 and 10 can contain up to 32 disks

Creating Vdisk

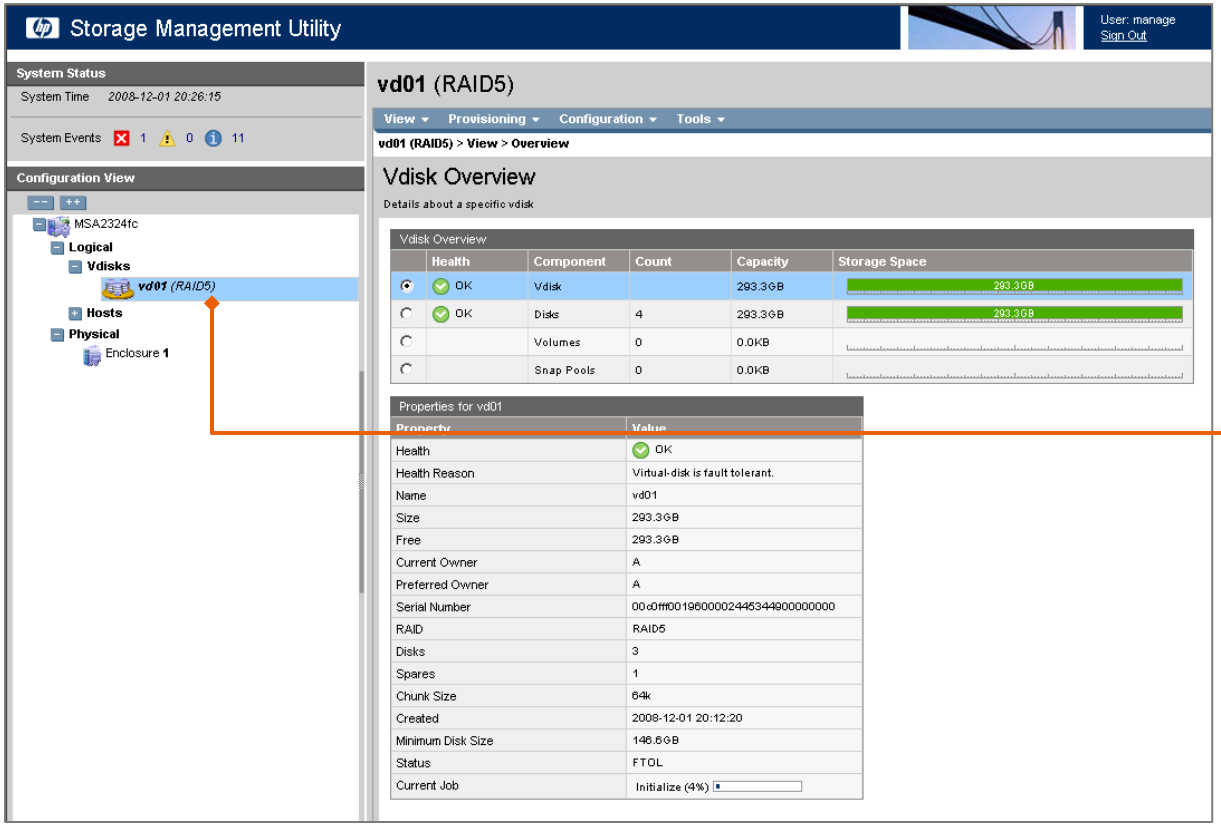


- Select the disks to include in the vdisk
- Select the RAID level
- Determine if you want a spare drive dedicated to this vdisk
- Click on "Create Vdisk"

Note – Drive Configs:

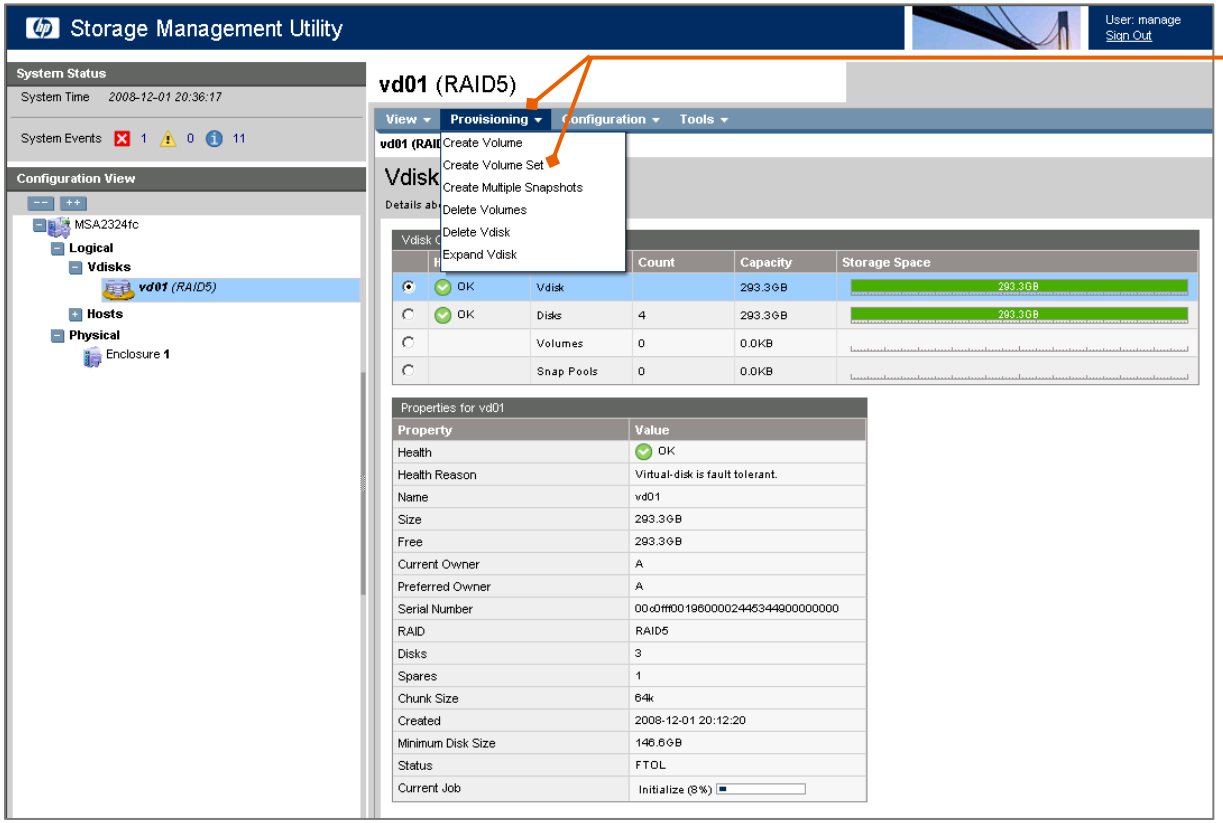
- RAID levels 3,5, 6 can contain a max of 16 disks
- RAID level 0, 50 and 10 can contain up to 32 disks

Creating Vdisk



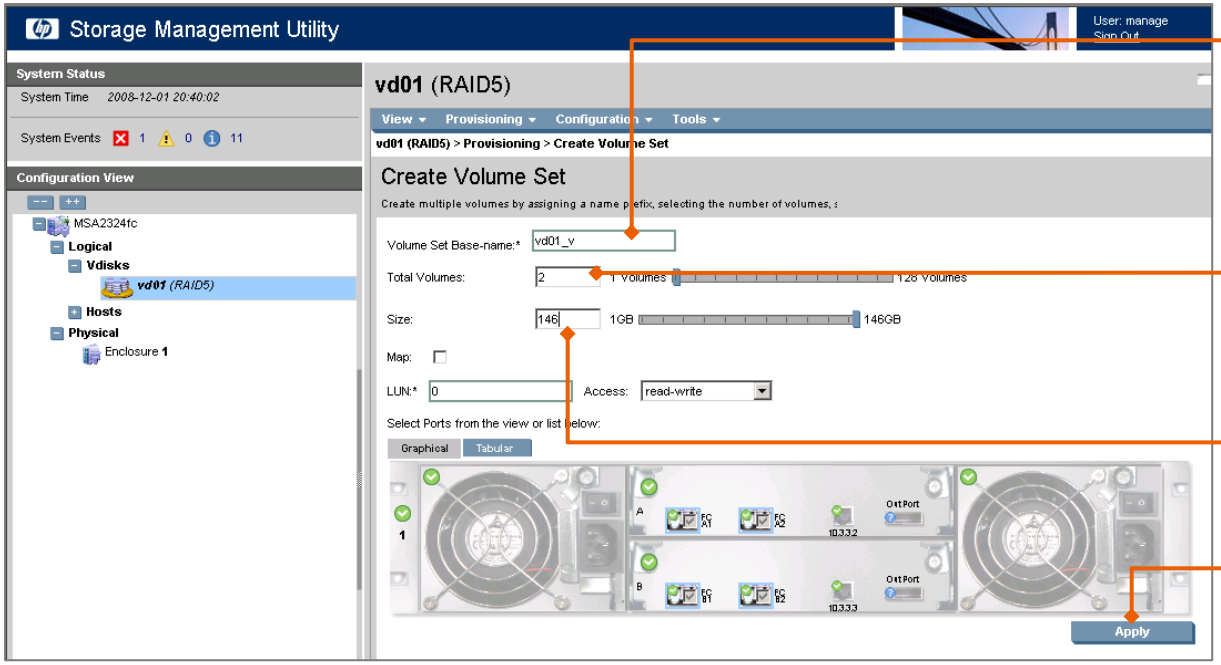
- You may now check the Vdisk properties by clicking on the newly created vdisk in the left panel

Creating volumes



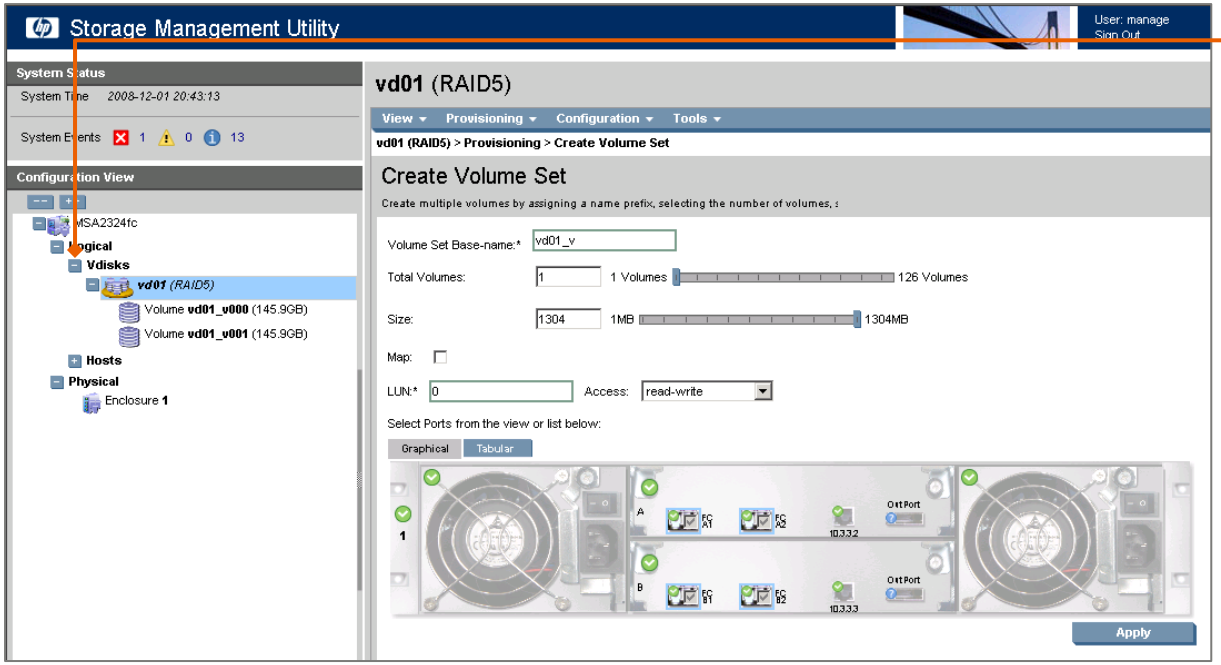
- Click on "Provisioning" and then on "Create Volume Set"
- Continue on next screen

Creating volumes



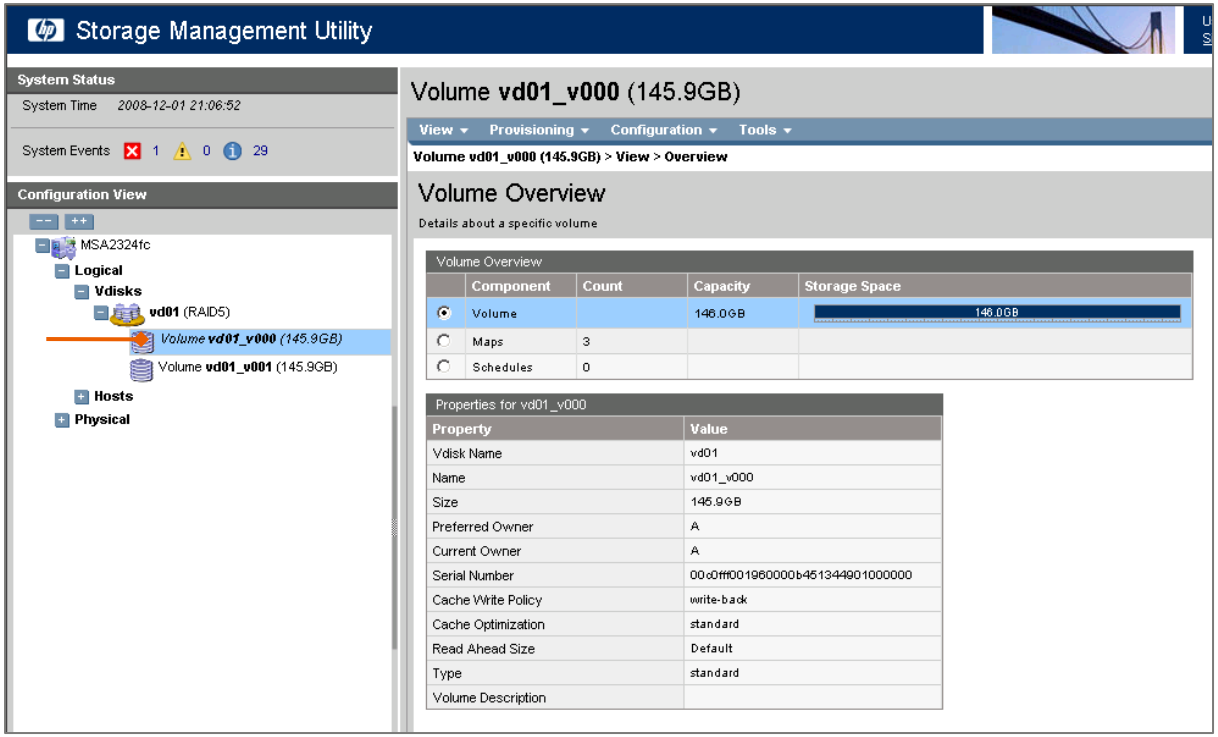
- You may want to change the "Volume Set Base-name"
- Enter the total number of volumes you want to create
- Enter the size of the volume
- Click on "Apply" to create the volumes

Creating volumes



- Click on the '+' next to the Vdisk. This will expand the Vdisk and you will see your new volumes

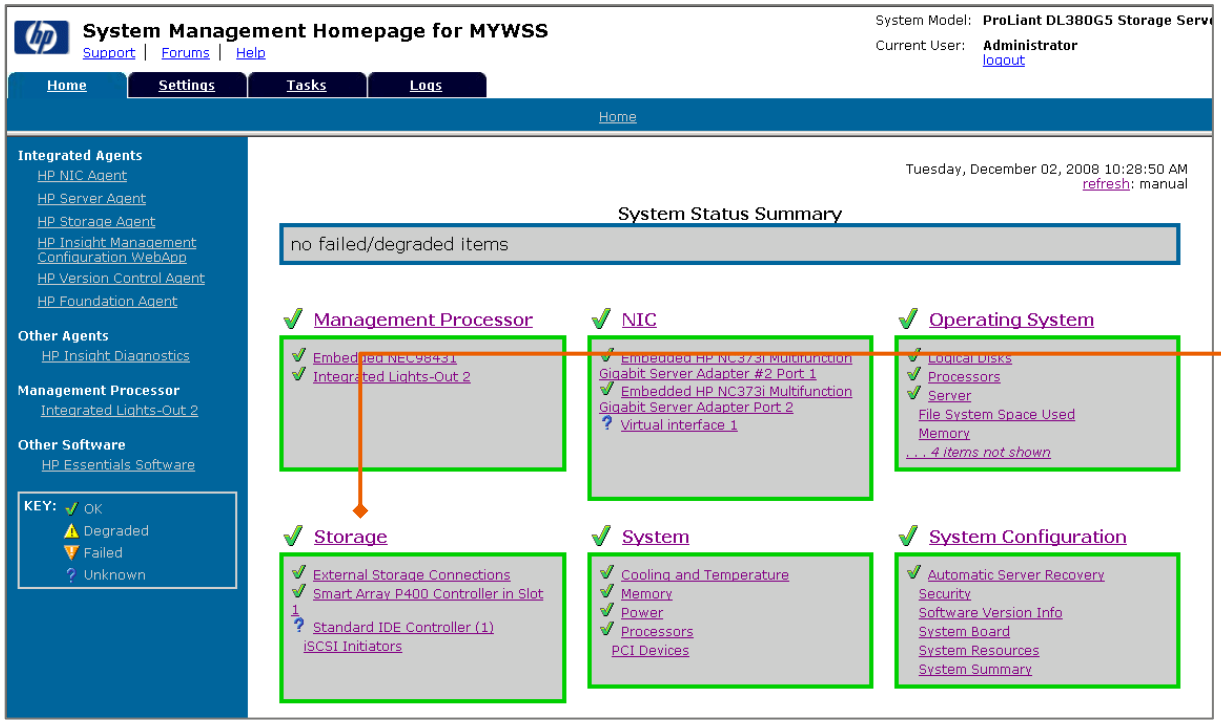
Creating volumes



- You may now check the Volume Overview by clicking on a volume in the left panel

TIPS: MSA2000 G2 allows you to expand or delete Volumes (LUNs) out of order

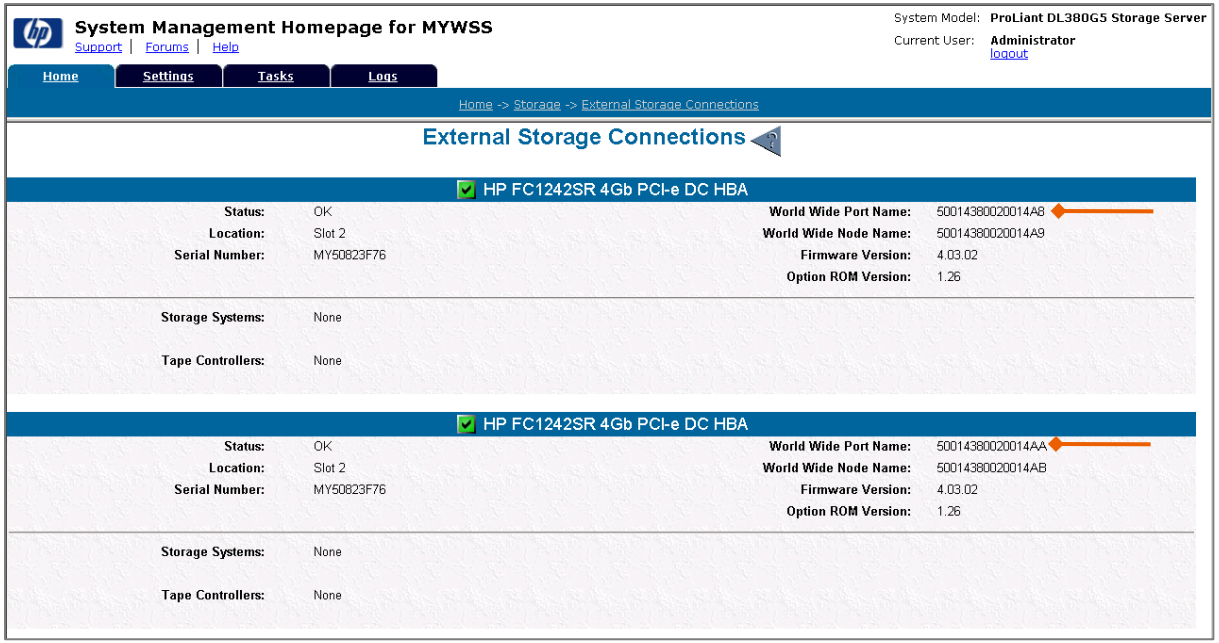
Mapping a volume



- Double click the icon on your desktop to launch the HP Systems Management Homepage

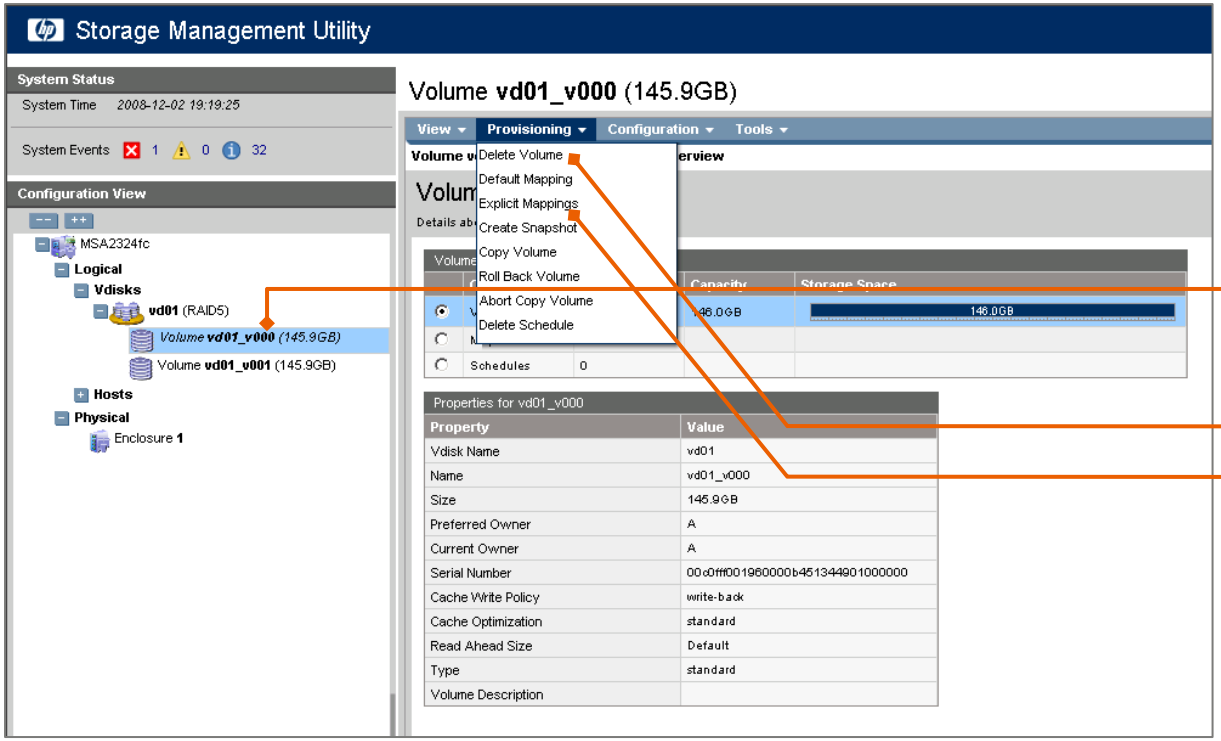
- Once the SMH has loaded, locate the block labeled 'STORAGE'.
- Within the block, locate and click the link labeled 'EXTERNAL STORAGE CONNECTIONS'

Mapping a volume



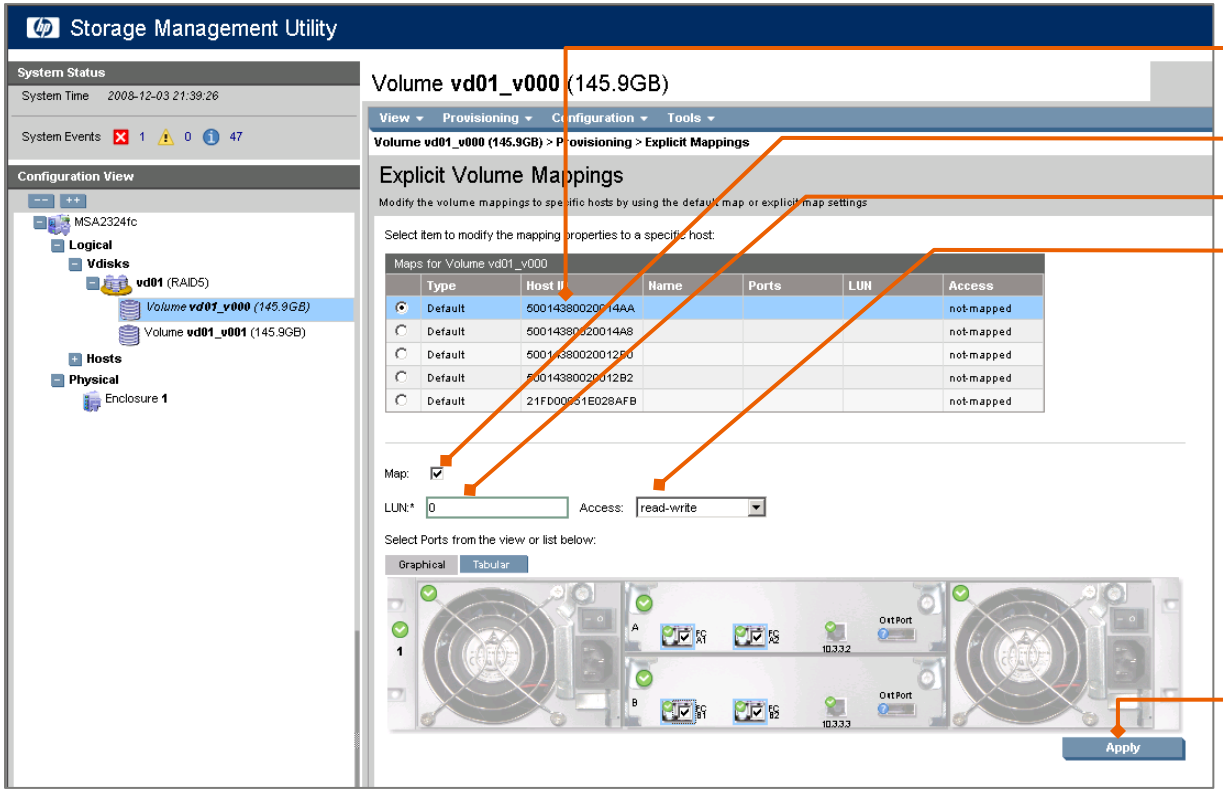
- This page shows details on the fibre channel HBA installed in the server.
- Locate and write down both of the 16 digit values next to the World Wide Port Name. This is the number displayed in the MSA2324fc LUN Mapping table.

Mapping a volume



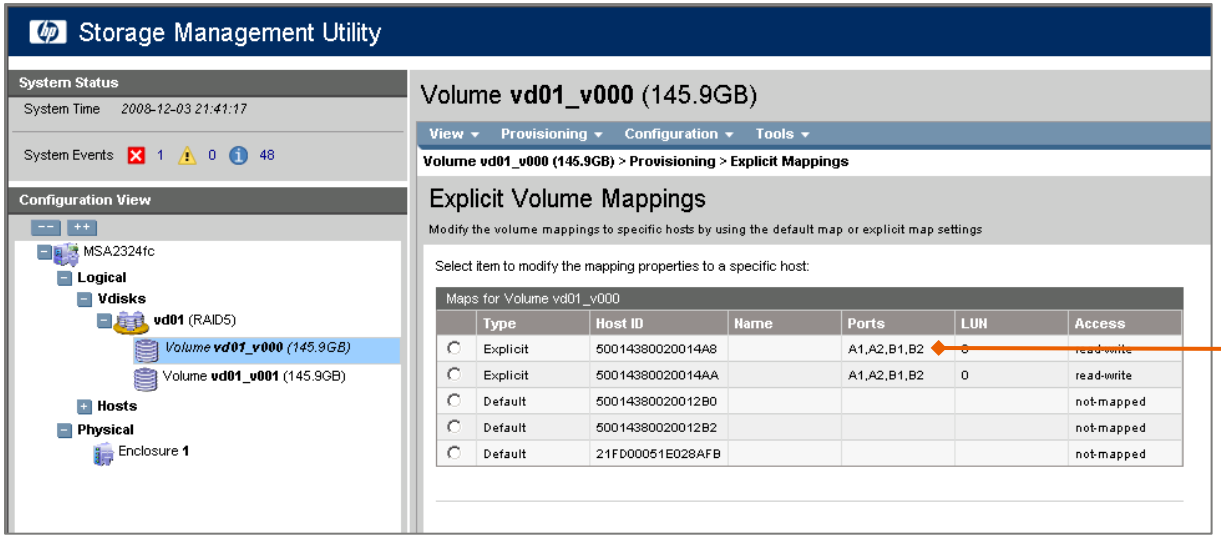
- Return to the MSA2324fc Management GUI
- Highlight the first volume
- Select on the menu 'Provisioning' then 'Explicit Mappings'

Mapping a volume



- Select one of the Port WWNs
- Check the 'Map' box
- Enter a LUN ID
- Pull down the 'Access' drop down menu and select 'Read-Write'
- Click on the port that you wish to allow 'Read-Write' access on. You must also Click on each port you wish to use for host access.
- Then click on 'Apply'
- Click 'OK' on the success window

Mapping a volume



- Notice that the mapping has changed for the port you have configured.
